## 1 Patterns

The first collection of News Knitter consists of ten unique sweaters. Patterns of these sweaters are generated by using two different live data sources and analyzing-filtering algorithms.

### 1.1 Daily Patterns

One set of patterns is generated with online global news of a particular day. Live global news items which were broadcasted within 24 hours are analyzed and filtered according to their time of publishing and their popularity. The filtered data is then visualized in two different graphic styles.

#### 1.1.1 DAILY-TXT

Headlines of news items are arranged according to their time of publishing. The point size of the headline, the radius of the bullets next to the headlines and the length of the horizontal lines indicate the popularity of a particular item. All graphical elements of a news item are normally in dark blue. If a news item has been published in over 700 different sources, the color of its elements turns into red.

#### 1.1.2 DAILY-GFX

Every news item is represented by a circle, a line and a plus sign. The radius of the circles, the length of the lines and the size of the plus signs indicate the popularity news items. All graphical elements of a news item are normally in dark blue. If a news item has been published in over 700 different sources, the color of its elements turns into red.

### 1.2 Thematic Patterns

Second set of patterns is generated with local Turkish news of a period based on particular themes. Each theme is expressed through two complementary keywords. Two main themes were designated for the first collection of News Knitter expressed with the keywords military-education and Asia-Europe. Live local Turkish news items broadcasted within 3 months are analyzed and filtered according to their contextual association with the predefined pairs of keywords. The frequency of appearance of the complementary keywords in news items is compared. The filtered data is then visualized in two different graphic styles.

#### 1.2.1 THEMATIC-BAR

Each bar represents a news item that is associated with one of the complementary keywords arranged chronologically from upper left to lower right. Each of the two colors represents a keyword. For the first theme, red represents Europe whereas blue represents Asia and for the second theme, red represents military whereas blue represents education. The length of the bars depends on the frequency of the repetition of a keyword in a single news item.

#### 1.2.2 THEMATIC-PLS

Each plus sign and gray dot represents a news item arranged chronologically from upper left to lower right. The gray dots represent the irrelevant news items that are not associated with any keyword. Each of the other two colors represents a keyword. For the first theme, red represents Europe whereas blue represents Asia and for the second theme, red represents military whereas blue represents education. The size of the plus signs depends on the frequency of the repetition of a keyword in a single news item.
